

CSC 148: Introduction to Computer Science

Week 6

University of Toronto Mississauga,
Department of Mathematical and Computational Sciences

Reminder: Midterm today!

- Tonight is our first midterm!
- Please check Piazza for details.
- If you are unable to make the midterm, please contact the course instructor email ASAP.

*“In order to understand recursion ...
you must first understand recursion”*

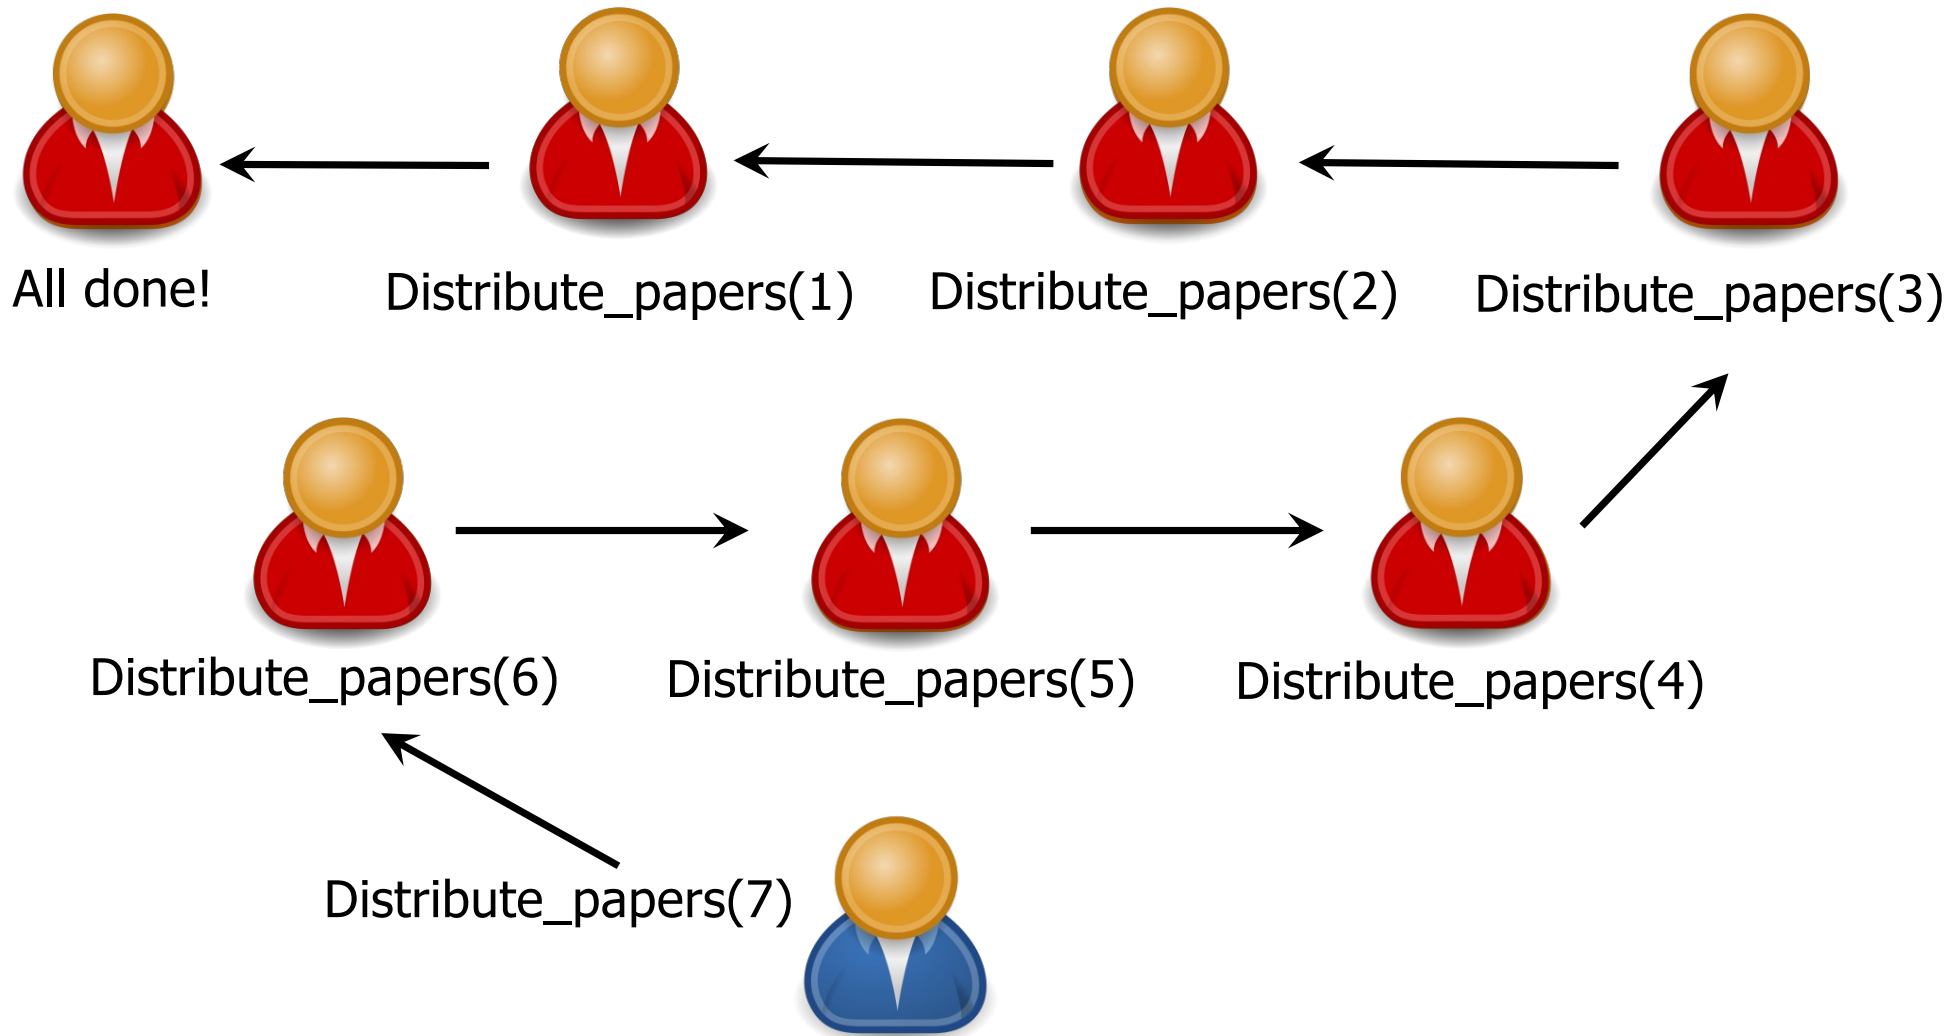

What is Recursion?

- Solve a problem by using an algorithm that calls itself on a smaller problem
- With each call, the problem becomes simpler
- At some point, the problem becomes trivial!

Using recursion – example 1

Using recursion – example 2

Idea: Keep one for me,
pick 2 students nearby,
and give each half of
your remaining pile

Using recursion – example 2

Idea: Keep one for me,
pick 2 students nearby,
and give each half of
your remaining pile

What is recursion?

*“In order to understand recursion ...
you must first understand recursion”*

Actually, to understand recursion, one must
understand its components ...

Components of Recursion

- **Base Case:** *A trivial, immediately solvable case.*

Examples: Distributing zero papers, sorting 1 number.

- **Recursive Case:** *Any other situation.* Marked by subdividing the problem and solving part of it.

Examples: Distributing 10 papers, sorting a list of size 5000.

Dividing the Problem

- “N-1” approach: handle one entity, then call the recursion for N-1 entities
- Divide in 2 or more subproblems: apply recursion for each half, quarter, etc. of the problem
- Other ways (more later...)

Programmer Perspective

- Recursion is when a function calls itself directly
 - (mostly ... we won't talk about indirect recursion)
- Goal:
 - Calls itself to solve a smaller part of the problem, using the **same** function/algorithm
- In some cases, we need to combine the solution!

Sum of List Elements

List of integer elements: `List = [3, 4, 5]`

What's the sum of elements? Solve recursively.

```
def sum_list(L):  
    if len(L) == 0:  
        return 0  
    else:  
        return L[0] + sum_list(L[1:])
```

```
# main program  
...  
print(sum_list(List))
```

Sure, we could just use predefined `sum(List)`, or use a simple for loop.

Assume for now that we want an alternative solution using recursion.

Tracing

List = [3, 4, 5]

What's the sum of elements? Solve recursively.

```
def sum_list(L):  
    if len(L) == 0:  
        return 0  
    else:  
        return L[0] + sum_list(L[1:])
```

```
# main program  
...  
print(sum_list(List))
```

Main program $\text{sum_list}([3,4,5])$?

$\text{sum_list}([3,4,5]) \rightarrow 3 + \text{sum_list}([4,5])$

$\text{sum_list}([4,5]) \longrightarrow 4 + \text{sum_list}([5])$

$\text{sum_list}([5]) \longrightarrow 5 + \text{sum_list}([])$

$\text{sum_list}([]) \longrightarrow 0$

More Complex Problems

- Why do all this? This could simply be solved with predefined 'sum' function
- What if L's elements can be lists themselves?
 - $L = [1, [5, 3], 8, [4, [9, 7]]]$

Will this work?

```
s = 0
for elem in L:
    s += elem
```

What about this?

```
s = 0
for elem in L:
    if isinstance(elem, list):
        for subelem in elem:
            s += subelem
    else:
        s += elem
```

- Nested lists can occur at any depth \Rightarrow complicated!

Sum of List Elements – Nested Lists

- $L = [1, [5, 3], 8, [4, [9, 7]]]$

```
def sum_list(L):  
    if isinstance(L, list):  
        recursive  
        step {  
            s = 0  
            for elem in L:  
                # calculate the sum of the sublist "elem" recursively  
                s += sum_list(elem)  
            return s  
        }  
    base  
    case {  
        else:  
            return L  
    }
```

Sum of List Elements – Nested Lists

- $L = [1, [5, 3], 8, [4, [9, 7]]]$

```
def sum_list(L):  
    if isinstance(L, list) :  
        s = 0  
        for elem in L:  
            # calculate the sum of the sublist "elem" recursively  
            s += sum_list(elem)  
        return s  
    else:  
        return L
```

recursive step

base case

Partial Tracing Practice

- Attempting to fully trace recursive code is time-consuming and error prone.
- When tracing recursive code, **don't** trace into recursive calls!
- Instead, assume each call is correct, and make sure the rest of the code uses those calls correctly.
- Worksheet ...
